

1                                    Abstract of the Disclosure

2

3                    The invention provides a method and system for adaptive point to multi-  
4 point wireless communication. The wireless physical layer and the wireless media-  
5 access-control (MAC) layer collectively include a set of parameters, which are adaptively  
6 modified by a base station controller for communication with a plurality of customer  
7 premises equipment. The base station controller adjusts communication with each cus-  
8 tomer premises equipment individually and adaptively in response to changes in charac-  
9 teristics of communication, including physical characteristics, amount of communication  
10 traffic, and nature of application for the communication traffic.
